

ACRYLICS

*The **ONLY** thing between a great **LAMP** and a great **TAN**.*

You've invested in brand new lamps. You've spent long hours getting your tanning equipment ready for the season. Customers are standing in line, anxious to get a great tan!

But when was the last time you changed your acrylics??

Over time, acrylic material **DECOMPOSES** and **BLOCKS** UV rays. This results in less color development for the tanner and more dissatisfied customers for you, the salon owner!

The average lifespan of a quality acrylic is between 1500 and 3000 hours. This will vary based on unique salon conditions and maintenance programs.

To **MAXIMIZE** the efficiency and longevity of your acrylics follow this simple maintenance schedule:

DAILY- Clean acrylics after every session with approved disinfectant. Check for cracks.

WEEKLY- Clean & polish bench and canopy acrylics. Remove and clean acrylic tracks when applicable. Wipe and remove dust from around lamps and fans.

MONTHLY- Inspect for cracks, scratches, and yellowing. Check UV transmission of acrylics with a UV meter, replace if necessary.
